

Planting scheme for the vegetable planter / frog shelter

← tomato plant

← marigold plant

← carrot

The fact that the vegetable planter is elevated will go some way in preventing carrot fly from reaching the carrots as they don't usually fly higher than 60cm off the ground. The scent of the carrots will be disguised by the tomato and marigold plants. Sow the carrots sparsely to avoid having to thin the seedlings as the disturbed roots will give off the tell tale carrot smell that the flies are attracted to.
